

Project GitHub Guide

Welcome! This project will run using real-world GitHub workflows.

Please read this once — it will save you a lot of confusion.

How We Use GitHub

We follow a simple structure:

- **Issues = Tasks**
- **Branches = Your workspace**
- **Pull Requests (PRs) = Your contribution**
- **Main branch = Stable project (no direct edits)**

You pick an issue → create a branch → work → open PR.

Golden Rule

❌ Do NOT push directly to `main`

✅ Always use branches + PRs

Workflow (Follow This Every Time)

Step 1 — Pick an Issue

Go to the Issues tab and assign yourself a task.

Step 2 — Clone the Repo (First time only)

```
git clone <REPO_URL>
cd <REPO_NAME>
```

Step 3 — Create a Branch

Name branches clearly:

```
git checkout -b feature/my-task-name
```

Examples:

- feature/scoring-metric
- docs/attention-summary
- experiment/prompt-dataset

Step 4 — Make Your Changes

Work normally in your editor.

Step 5 — Stage Changes

```
git add .
```

Step 6 — Commit

```
git commit -m "Short description of what you did"
```

Good examples:

- "Add cosine similarity scorer"
- "Write attention mechanism doc"

Step 7 — Push Your Branch

```
git push origin feature/my-task-name
```

Step 8 — Open a Pull Request (PR)

1. Go to GitHub
2. Click **Compare & Pull Request**
3. Fill title + description
4. Submit PR

That's it 🎉

What is a Pull Request?

A PR means:

| “I finished my work. Can this be merged into main?”

All contributions go through PRs.

Branch Naming Rules

Use prefixes like these please:

- feature/ → new functionality
 - fix/ → bug fixes
 - docs/ → documentation
 - experiment/ → experiments
-

PR Guidelines

Keep PRs:

- Small
- Clear
- Focused on one task

Avoid giant PRs.

If You Get Stuck

Do NOT struggle silently.

Options:

- Ask in project chat
 - Tag your track lead
 - Open a draft PR for help
-

Common Mistakes

- ✗ Working on main branch
 - ✗ Giant commits with unclear messages
 - ✗ Waiting days before pushing
-

Pro Tips

- Commit often
 - Push early
 - Open PRs even if not perfect
 - Progress > perfection
-

Final Note

We're using this workflow because it's how real engineering teams work.

Don't stress — you'll learn fast.

Let's build something great together
